Approvals			

¹ Maximum inputs for packaged blower versions are given for the standard combustion air blower without an inlet air filter.

² For proper performance, this pressure must be kept constant across the burner operating range.

³ See page 3 of this datasheet and Installation Guide 111 for "Refractory Plug Only" installation.

⁴ See Design Guide 111 for more information about typical fuel composition and properties.

⁵ All weights are approximate.

- All inputs are based on gross calorific values and standard conditions: one atmosphere, 70°F (21°C).
- All information is based on laboratory testing. Different chamber size and conditions will affect data.
- Eclipse reserves the right to change the construction and/or configurations of our products at any time without being obliged to adjust earlier supplies accordingly.

Fuel/Input Measurement

System design must include fuel flow measurement upstream of the burner. Eclipse recommends its 4-5 FOM (Fuel Orifice Meter) assembly number 302084-5 for natural gas. See Bulletin 930 for details.

Secondary By-Pass Fuel Setting:

Fuel	ΔP "w.c. (mbar)*
Natural Gas	4.0 (10.0)
Propane	1.0 (2.5)

*Measured between Tap "E" and the chamber @ low fire.

NOTE: Input at low fire changes with ratio regulator adjustment.

NO_x emission data is given for:

- Ambient combustion air (~70°F, 21°C)
- Less than 1000°F (540°C) firing chamber
- Minimal process air velocity
- Low fire input adjusted to 143,000 BTU/hr (42 kW)
- Neutral chamber pressure

Emissions are influenced by:

- Chamber conditions
- Fuel type
- Firing rate
- Ratio regulator adjustments
- Combustion air temperature

CO emissions are largely influenced by chamber conditions. Contact your local Eclipse representative for an estimate of CO emissions on your application.
